The drive to realise operational efficiencies, improve customer service, develop new markets and accelerate the introduction of new products has substantially increased the complexity of field service operations. To maximise the efficiency and effectiveness of these operations, organisations have embarked on a wide range of transformation programmes that have sought to introduce automation through the use of workforce management technologies. Despite the potential business value that can be provided by such transformation programmes, too often, the automation technologies have not been fully utilised and their expected benefits have as such not been realised. Scholars of organisation change argue that the success of any transformation programme is a function of how well the technical, political, structural and social aspects of a specific project have been managed. The objective of this edited book is to provide insights into how organisations might successfully transform their field service operations with the help of workforce management technologies. Accordingly, the book is organised into four sections: Section A "The Case for Transforming Service and Field Operations" explains the rationale as to why organisations should actively consider transforming their service and field operations, while Section B presents various "Methods, Models and Enabling Technologies for Transforming Service and Field Operations". In Section C, a number of "Case Studies" illustrate how new technologies can be applied to field and service operations to deliver concrete business benefits. Lastly, Section D considers "Challenges, Outcomes and Future Directions". Overall, this book provides valuable insights into how to successfully transform field service operations with automated technologies. It draws on years of experience from different industries and from different perspectives on realising change. It is aimed at managers, technologists, change agents and scholars who are interested in field service operations in general and the use of advanced computing technologies in this area in particular.

Special Text

Summary of Operations, Oil and Gas Fields

Psychological Warfare Field Operations

Field Operations of the Bureau of Soils

This volume assesses the development of human rights field operations of the United Nations and other intergovernmental organizations. It makes a substantial contribution to the debate and understanding with regard to the sector's underlying doctrine. The book, unprecedented in its scope, addresses the range of aspects of the nature, role and activities of field operations. It draws together the reflections of academics, policy makers and field practitioners. Its analysis is located within the context of applicable normative and ethical frameworks, assessment of former and current practice and examination of complementary and analogous experiences. The book will be an essential resource for all those actively involved in human rights field work as well as for policy makers and academics and students involved in human rights research.

A Guide for Inspection and Enforcement

Report of the Governor of New Mexico to the Secretary of the Interior

Germany's imaginative employment of transport aircraft in World War II produced as many innovations as Germany's use of tanks. Indeed, like the tank, the transport aircraft was closely associated with the Blitzkrieg concept. This relationship was advantageous at the outset of the war, but it became dangerous as the war dragged on and German armies outran their surface supply lines in North Africa and Russia. Then ground commanders began to think of air transport as the means of supply. The history of this trend is one of the main themes of this study, which was first published in its English translation in 1961. Some of the questions embodied in this theme—How much air transport is enough? Under what conditions is an air-supply operation feasible? What are the prerequisites for a successful airlift to encircled ground forces? What are the advantages and limitations of the glider?—are as vital and controversial today as they were during World War II. Generalmajor a. D. Fritz Morzik, who began his military career as a non-commissioned officer in the German Air Service in World War I and ended it as Armed Forces Chief of Air Transport in World War II, is especially well-qualified to write the present study. His long career, spanning two world wars, and his experience with both civilian and military transport aircraft testify to the breadth of his practical knowledge.
