anniversary of Ayrton Senna's death, Christopher Hilton marries and updates four of his earlier titles about the legendary driver into one volume of more than 100,000 words. He chronicles Senna's entire story, from the wealthy childhood in Brazil to his fatal crash in 1994. It is a fast-moving and comprehensive account of an extraordinary life that will appeal to the wider public as well as to Senna fans.

This book contains the proceedings of the International Conference on Artificial Neural Networks which was held between September 13 and 16 in Amsterdam. It is the third in a series which started two years ago in Helsinki and which last year took place in Brighton. Thanks to the European Neural Network Society, ICANN has emerged as the leading conference on neural networks in Europe. Neural networks is a field of research which has enjoyed a rapid expansion and great popularity in both the academic and industrial research communities. The field is motivated by the

commonly held belief that applications in the fields of artificial intelligence and robotics will benefit from a good understanding of the neural information processing properties that underlie human intelligence. Essential aspects of neural information processing are highly parallel execution of computation, integration of memory and process, and robustness against fluctuations. It is believed that intelligent skills, such as perception, motion and cognition, can be easier realized in neuro-computers than in a conventional computing paradigm. This requires active research in neurobiology to extract computational principles from

experimental neurobiological findings, in physics and mathematics to study the relation between architecture and function in neural networks, and in cognitive science to study higher brain functions, such as language and reasoning. Neural networks technology has already lead to practical methods that solve real problems in a wide area of industrial applications. The clusters on robotics and applications contain sessions on various sub-topics in these fields.

Corruption persists as a challenge to the consolidation of Latin American democracies and to their economic development. Contrary to many expectations, policies to reduce the size of government, such as the privatization of state firms, have not proved a cure against corruption. In some cases, economic liberalization seems only to have worsened the problem. *Combating Corruption in Latin America* examines the relationship between democratic and market reforms and corruption, including national strategies for its reduction. Authors from across the region, the United States, and Europe, discuss the nature, methods, and historical antecedents of today's corrupt practices, including issues of institutional design, the role of international actors, and culture. These chapters raise many

important questions. Can corruption in some cases be economically efficient? Does the transition to democracy and free markets increase or reduce opportunities and incentives for corruption? What policy responses are in effect at the local, national, and international levels, and are they likely to be effective? How is a growing business culture across Latin America likely to influence efforts for improved government transparency and efficiency? Contributors come from the worlds of academia, government, journalism, and international financial institutions, and bring a range of economic and political perspectives to bear on the subject. They are Alberto Ades, Fernando Carrillo-Flórez, Carlos Eduardo Lins Da Silva, Rafael Di Tella, Edmundo Jarquin, Luigi Manzetti, Luca Meldolesi, Luis Moreno Ocampo, Stephen Quick, Susan Rose-Ackerman, Mark L. This paper studies the transmission of crime shocks to the economy in a sample of 32 Mexican states over the period from 1993 to 2012. The paper uses a panel structural VAR approach which accounts for the heterogeneity of the dynamic state level responses in GDP, FDI and international migration flows, and measures the transmission via the impulse response of homicide rates. The approach also allows the study of the pattern of economic responses among states. In particular, the percentage of GDP devoted to new construction and

there's never been anything like a comprehensive source for such information. That's what preeminent baseball analyst Bill James and ESPN.com baseball columnist Rob Neyer realized over lunch more than a dozen years ago. Since then, they've been compiling the centerpiece of this book, the "Pitcher Census," which lists specific information for nearly two thousand pitchers, ranging throughout the history of professional baseball. The Guide also offers: A "dictionary" describing virtually every known pitch The origins and development of baseball's most important pitches Top ten lists: best fastballs, best spitballs, and everything in between Biographies of some of the great pitchers who have been overlooked More knuckleballers and

It's also about entertaining debates and having a great deal of fun with the history of a game that obsesses so many.

This book is the author's attempt at explaining how he came up with a mental system of the calendar (Julian and Gregorian) which was later converted into a tangible prototype. Also attached herein is the author's design for a two - dimensional perpetual calendar for both systems that can be used to check the veracity of one's mental calculations. Likewise, the process by which the codes were assigned or derived were also explained to establish the periodic cycles in

both calendar systems. The rules for leap years for both systems were similarly discussed to illustrate the apparent difference between the Julian and Gregorian Calendar. Surprisingly, the Perpetual Calendar Formula itself only involves the operations addition and modulo seven if the final answer is not within the range of the Day Codes. Subtraction is only done for the dates in January and February of a leap year. The ultimate goal is to be able to make the computations mentally and it requires memorization of the Codes for Days, Dates, Months, Years and Centuries as well as

performing the correct addition and modulo application. With constant practice and active memorization, one can emerge as a human perpetual calendar.
