

User And Maintenance Manual For Generating Sets

This manual is for the use of personnel responsible for the operation and maintenance of this Transportable Helicopter Enclosure. (THE). This manual provides the user and maintenance personnel with the necessary instructions to use the shelter and to perform required maintenance services. The manual was initiated for use during Operational Test one which started in September 1982 but is applicable to all users of the THE.

Software modules for implementing drivers and menu tasks for system integration with the Hydrographic Upgrade to Oceanis (HUGO) are reported. The components comprising the HUGO system are the Harris 700 minicomputer, Megatek Whizzard 7200 graphic engine and Oracle Data Base Management System. The software is tailored specifically for the above system. The HUGO system is implemented as a combination Harris/VT100 configuration and a Harris/Megatek configuration. The Harris/VT100 configuration is operated from a VT100 terminal in a text mode and is comprised of shipboard software modules Hydrographic Post Time System (HPTS) converted to the Harris computer and interfaced to the Oracle Data Base Management System (DBMS). The converted modules will be used to load data into the DBMS and perform other tasks similar to shipboard operations. The Harris/Megatek configuration will operate in a graphics mode and be operated from any of three graphics work stations; the graphic stations will retrieve data from the DBMS, display the data and perform interactive edit operations. This User's and Maintenance Manual is presented in three sections: 1) Depth-Track/Contour Plot; 2) Tide Epoch Analysis; and 3) Interactive Graphics Analysis.

RMMS Manual

A software Instrumentation Package for use with the Extendable Computer System Simulator, Version 15 was written to facilitate the reporting of systems performance statistics in discrete system simulations. The software package was developed in the course of modeling the TRIDENT Strategic Weapon Fire Control System. The Instrumentation Package (IP) complements the Extendable Computer System Simulation language by creating data structures for statistics collection and by providing the mechanism for initialization, update and output of the contents of these structures. The end result of the IP is a set of specialized output reports which describe the activity of a simulated computing system during a user specified time interval. This report outlines the user input procedures and report options available with the software package. Detailed descriptions of the statistical collection methods, the functions of the IP routines and the interactions of the IP routines are included. Methods for updating the IP are also delineated. The software system is operational on the CDC 6700 computer at the Naval Surface Weapons Center, Dahlgren Laboratory, and the IBM 360/91 computer at the Applied Physics Laboratory, Johns Hopkins University.

This report documents a computer program, SWATHO, which optimizes SWATH ship geometry, resulting in a minimum resistance and EHP for a specified speed of the ship. Contained in the report is a detailed description of the procedure for assembling the input deck for use on the CDC-6000 computer system at DTNSRDC, running the program on this system and understanding the output from the program. Also included are main program and subroutine descriptions as well as theory behind the computations being performed.

The purpose of this effort is to develop the Maintenance Performance System—Organizational (MPS-O) which is an integrated system for measuring maintenance performance, diagnosing performance problems, taking corrective actions, and providing training. This report is the User's Manual for the operation of the MPS-O maintenance management information system (MMIS). The User's Reference Manual describes the MMIS reports, provides guidance on analysis and interpretation of the reports, and describes procedures for the operation of the MMIS.

User's Manual

This book describes the Highway Design and Maintenance Standards model (HDM-III) and its constituent components and provides a comprehensive discussion of the submodels, their interaction, and the operational parameters involved. The HDM-III is designed to make comparative cost estimates and economic evaluations of different construction and maintenance options, including different time-staging strategies, either for a given road project on a specific alignment or for groups of links on an entire network. The user can search for the alternative with the lowest discounted total cost and can call for rates of return, net present values, or first-year benefits. If the HDM is used in conjunction with the Expenditure Budgeting Model, the set of design and maintenance

Read Book User And Maintenance Manual For Generating Sets

options that would minimize total discounted transport costs or maximize net present value of an entire highway system under year-to-year budget constraints can be determined. The HDM-III model is not only a readily usable program for handling voluminous computations automatically, it is also a repository of the most extensive and consistent set of empirical data on the subject. The information includes the qualitative structure and quantitative parameters of relationships among construction standards, maintenance, traffic characteristics, road deterioration, and vehicle operating costs.
